ENTERPRISE

Decision DNA

An Institutional Memory Engine & Conflict Sentinel that evaluates tech specs and PRDs against past architectural decisions, post-mortems, and compliance policies in real-time.

ARCHITECTURE

Multi-Agent System

MODEL

Gemini Enterprise Plus

KNOWLEDGE BASE

Google Drive Connector & Direct Uploads

Employee ID: 1213383

Executive Summary

20% Weight

The Organizational Problem: Modern engineering teams suffer from severe **Corporate Amnesia**. Past architectural decisions (ADRs) are forgotten, post-mortems are ignored, and new engineers continually re-introduce past mistakes, vulnerabilities, and non-compliant vendors, leading to repeating incidents and massive technical debt.

Our Solution: Decision DNA operates as a "Conflict Sentinel". Using Vertex AI's Multi-Agent architecture and Knowledge Connector grounding (Google Drive), it autonomously analyzes new PRDs and code changes, immediately detecting contradictions against the organization's institutional memory and emitting structured **Conflict Cards** (past outages, ADRs, compliance policies, etc.).

Multi-Agent Architecture

15% Weight

SECTION 03

Core Prompt Engineering & Guardrails

15% Weight

The orchestrator and its specialized agents operate under stringent system instructions. These instructions compel the system to categorize threats, identify exact enterprise rule violations, and cite the precise institutional memory source.

Figure 2a: Main Orchestrator Prompt defining role, strict rules, and tool access boundaries

Figure 2b: System instructions enforcing specific formatting and explicit "Do Not Override" guardrails

SECTION 04

Enterprise Grounding 20% Weight

Decision DNA is powered by 16 critical enterprise memory documents. Using Vertex Agent Builder's native Google Drive Connector and direct Knowledge uploads, the agents perform real-time RAG against a unified knowledge base, accessing ADRs, architectural standards, post-mortems, and compliance policies.

Figure 3a: Knowledge configuration mapping Vertex agent to Enterprise Google Drive and File Uploads

Figure 3b: Grounding corpus containing Post-Mortems, ADRs, Security Policies, and Vendor Guidelines

SECTION 05

Conflict Sentinel in Action 20% Weight

By simulating a PRD review (DataViz Integration), we comprehensively prove the capability of the **Conflict Sentinel** to intercept bad architectural proposals before they are implemented.

Figure 4a: GDPR Data Residency violation (Conflict 1) identified during PRD review, correctly referencing `Data_Classification_Policy.txt`

Figure 4b: Detection of an unapproved third-party vendor (DataViz Corp) referenced by `Vendor_Management_Policy_2025.txt`

Figure 4c: Sentinel blocking a proposed Synchronous API call, enforcing the enterprise event-driven standard (ADR_018)

SECTION 05 (CONTINUED)

Post-Mortem Intelligence Integration

The Final Protective Layer: Decision DNA proactively connects proposed code changes or tech specs directly to historical post-mortems. When an engineer attempts a risky implementation, they are alerted to past incidents caused by the exact same architectural flaw.

Figure 4d: Code Review Judge catching PII logging and explicitly referencing "Post_Mortem_PII_Leak_2025_01.txt" as historical proof of consequence.

Setup & Continuous Monitoring

10% Weight

To ensure 100% compliance coverage, Vertex AI Agent scheduled executions can invoke the agent against newly committed documents or codebase PRs automatically.

Scalability, Business Value & Responsible AI

10% Weight

Enterprise Scalability Roadmap

PHASE	TIMELINE	SCOPE	GOOGLE CLOUD SERVICES
PoC (Current)	2–3 weeks	2 sub-agents, 16 enterprise docs, PRD + Code Review	Vertex AI Agent Builder, Gemini Enterprise Plus, Google Drive Connector
MVP	4–6 weeks	CI/CD integration (GitHub/GitLab hooks), auto-trigger on PR merge, Jira linking	+ Cloud Functions, Eventarc, BigQuery audit trail, Pub/Sub
Production	8–12 weeks	500+ ADRs indexed, cross-team conflict detection, compliance dashboard	+ Vertex AI Search, Looker, Cloud Spanner, Document AI

Quantitative Business Impact

70%

REPEAT INCIDENTS PREVENTED

GROUNDED CITATIONS

💰 **Strategic Value for TCS:** Decision DNA transforms TCS into an **Architecture Governance Partner** for enterprise clients. By converting passive ADRs and post-mortems into an active enforcement layer, it prevents costly architectural regressions — the kind that cause repeat outages costing **\$100K–\$1M per incident**. This creates a reusable, scalable IP asset applicable across every TCS account managing complex engineering organizations.

Security & Responsible AI

ASPECT	IMPLEMENTATION
Data Privacy	Agent has read-only access to enterprise memory. No code execution or write permissions to source repos.
Hallucination Prevention	Every conflict detection grounded via Google Drive Connector — cites specific ADR, post-mortem, or policy document.
Human-in-the-Loop	All conflict assessments are advisory. Engineers and architects make the final decision — agent recommends, not enforces.
Access Control	Multi-agent routing ensures sub-agents only access their designated document scope. No cross-boundary leakage.
Synthetic Data	All ADRs, policies, post-mortems, and vendor guidelines are synthetic — no real organizational data.

SECTION 08

Conclusion & Evidence Checklist

Decision DNA solves Corporate Amnesia by creating an active, intelligent immune system for enterprise architecture. By integrating Vertex AI's Multi-Agent architecture with a native Document Grounding Data Store, we shift from passive policy documents to active architectural enforcement, reducing technical debt and mitigating repeating outages.

APPENDIX A

Agent System Instructions & Security Guardrails

ORCHESTRATOR AGENT — SYSTEM INSTRUCTIONS

Multi-Agent Routing Logic

You are the "Decision DNA Orchestrator" — the central routing agent for a multi-agent enterprise memory system.

YOUR SPECIALIST AGENTS

AGENT 1 — "Conflict Sentinel"

TRIGGER: User submits a draft document, PRD, proposal, or design doc for policy/compliance/architectural violation review.

ALSO TRIGGER: When a user asks "why" a past decision was made, or asks about rationale/history.

ALSO TRIGGER: When a user asks "what if" regarding policy or architectural changes.

AGENT 2 — "Code Review Judge (CRJ)"

TRIGGER: User submits code snippets, PR diffs, configs, IaC (Terraform/YAML), API specs, or DB schemas.

ALSO TRIGGER: User asks whether code follows enterprise standards.

ROUTING RULES

- DOCUMENT or PROPOSAL (natural language) → Conflict Sentinel
- CODE, CONFIG, or TECHNICAL IMPLEMENTATION → Code Review Judge
- Contains BOTH → Route to BOTH agents, combine outputs
- General "why did we..." questions → Conflict Sentinel

SECURITY & GUARDRAILS (MANDATORY)

- DATA PRIVACY & PII PREVENTION: NEVER output or request PII.
- ZERO HALLUCINATION: EVERY claim must be grounded in provided instructions.
- HUMAN-IN-THE-LOOP: Always append advisory disclaimer.

CODE REVIEW JUDGE (CRJ) — ENTERPRISE COMPLIANCE ENGINE

ADR-Grounded Code Review

REVIEW CHECKLIST (Always Check These):

- ☐ Inter-service communication uses Pub/Sub (not sync REST) per ADR-018
- ☐ External APIs route through API Gateway per ADR-031
- ☐ User profile storage uses Firestore (not Cloud SQL) per ADR-042
- ☐ Cloud resources have required labels per ADR-055

- ❑ Audit logs retained ≥ 90 days per Global Security Policy v4
- ❑ Data at rest uses AES-256 encryption with CMEK
- ❑ EU data not processed outside approved regions per GDPR Addendum
- ❑ Personal data pseudonymized before analytics/ML use
- ❑ Payment API changes don't degrade P95 < 400ms per Payment API SLA v2.1
- ❑ No hardcoded secrets, API keys, or credentials in source code
- ❑ Container images use distroless base images
- ❑ Deployments use approved regions only (us-east4, europe-west1, us-central1)

POST-MORTEM INTELLIGENCE:

If code pattern matches one that caused a past incident (e.g., PII logging → PII Leak 2025-01, sync REST chains → Payment Outage 2024-07), cite the post-mortem.

OUTPUT JUDGMENT CARDS:

🔍 FINDING [number]: [Short Title]

> **Verdict:** 🔴 REJECT / 🟡 NEEDS CHANGE / 🟢 ADVISORY

> * 📍 Location: [File/line reference]

> * ❌ What's Wrong: [Explain the violation]

> * 📖 Enterprise Rule: [Cite the specific policy/ADR]

> * 📎 Evidence Source: [Document name, section, date]

> * 🔗 Related Context: [Post-mortem citation if applicable]

> * ✅ Fix Required: [Exact code change needed]
