POLICY BOTS ARE LLM-
BASED

The Core Problem: Most enterprise chatbots built on an LLM (Gemini, GPT-4, etc.) share the same core flaw: it *generates* policy answers rather than *retrieving* them. For compliance-critical domains like KYC, DPDPA consent, HR benefits, or insurance claims — a hallucinated answer that miscommunicates a policy boundary is not just a UX failure. It's a regulatory violation, a legal liability, and a brand crisis.

Real-World Hallucination Risks That Keep Compliance Teams Awake

("Bot told me I'm eligible for a loan") Scenario: A KYC chatbot powered by Gemini incorrectly tells a customer they qualify for a pre-approved loan based on a misinterpreted policy. Customer applies, gets rejected. Files SEBI grievance. Bank faces hearing.

("Bot confirmed I'm GDPR compliant") Scenario: An enterprise onboarding bot hallucinates a "yes" to "Does your product store data only in India?" when the actual policy requires EU customers to have data in Frankfurt. Regulator audit reveals the gap 18 months later. €500K fine.

THE SOLUTION

Policy-Compiled Flows — Zero Hallucination at Runtime

Policy-to-Flow Compiler uses **Gemini on Vertex AI** *once* — at compile time — to translate enterprise policy documents into deterministic Dialogflow CX flow graphs. At runtime, the chatbot follows pre-compiled nodes. At runtime, the **policy engine decides outcomes deterministically**. If an LLM is used, it is strictly limited to phrasing (tone/clarity) and cannot change decisions or policy boundaries.

Determinism Guarantee: "0% hallucination" here means *0% decision/outcome hallucination* — policy eligibility and results are computed by the deterministic Flow DSL + Policy Engine. The LLM (if enabled) is constrained to language only and cannot override policy rules.

Unified PoC Scope (Hackathon Evidence): The live implementation compiles and validates **three enterprise policy domains** — **Return & Refund**, **KYC Verification**, and **Warranty & Service** — with **FUZZ-2026-0414-ENTERPRISE-BATCH-01** fuzz audit coverage and a traceable Compliance Certificate.

The Architecture Insight: LLMs are powerful but non-deterministic. The innovation is moving LLM usage from "answer generation" (risky) to "policy compilation" (safe). The compiled flow is a legal and auditable artifact — as inspectable as a policy document itself. Every chatbot response traces back to a specific policy clause, enabling instant audit compliance.

Concern	Traditional LLM Chatbot	Policy-to-Flow Chatbot	Benefit
Hallucination Risk	Always present (non-deterministic)	Zero at runtime	Compliance-safe
Policy Updates	Retraining or prompt engineering	Re-compile policy → re-deploy	Hours vs. weeks
Audit Trail	LLM generation — unverifiable	Node-by-node policy citation	Regulator-ready
Edge Case Coverage	Unknown, untested at deploy	8,182+ paths fuzz-tested	Quantified confidence
Build Time	6–12 months (conversation design)	Hours (automated compilation)	10–50x faster

COMMERCIAL VALUE SUMMARY — PER ENTERPRISE CHATBOT DEPLOYMENT

TCS Commercial Opportunity

- 1

Compliance Chatbot Factory: Offer Policy-to-Flow as a managed service — clients provide policy documents, TCS delivers production Dialogflow CX flows within 48 hours. ₹20–50L per policy domain. 100 policies/year = ₹20–50Cr revenue stream.
- 2

Regulatory Chatbot Auditing: Offer clients a "Compliance Audit as a Service" — fuzz-testing their existing chatbots against their own policy documents. Identifying compliance gaps before regulators do. ₹10–25L per audit engagement.
- 3

BFSI / Healthcare Vertical Play: Policy-to-Flow is purpose-built for regulated industries. TCS's 400+ BFSI relationships provide an immediate channel to enterprises with compliance chatbot requirements mandated by DPDPA, RBI, and IRDAI regulations.
- 4

Google Dialogflow CX Partnership: As a Dialogflow CX ecosystem player, TCS can pursue a joint Google Cloud partnership — co-developing an enterprise compliance chatbot template library and gaining access to Google's enterprise sales channel and Marketplace co-sell program.

Why Now: DPDPA 2023 enforcement, RBI IT Framework 2023, and SEBI Cybersecurity guidelines are all driving enterprises to urgently deploy compliant customer-facing AI. Policy-to-Flow is the only approach that provides a *mathematically demonstrable* compliance guarantee at scale — exactly what CISO and compliance officers need to sign off on chatbot deployments.
